affordable housing production and suggested that the methodology may not have effectively achieved its intended equity objectives in high land-value communities.

Marle Chen, California State Council on Developmental Disabilities, highlighted the importance of increasing housing accessibility for individuals with disabilities, including persons receiving regional center services and older adults. She noted ongoing collaboration with HCD and emphasized the need to incorporate the housing needs of people with disabilities into RHNA-related discussions. Ms. Chen expressed support for expanding affordable and accessible housing opportunities for underserved populations, offered the Council as a resource to the Subcommittee, and encouraged continued collaboration with SCAG on accessible housing, transportation accessibility, and mobility issues affecting individuals with disabilities.

Jake Pierce, a resident of Los Angeles, expressed support for expanding the social equity framework and encouraged consideration of the option that would incorporate a broader range of opportunity-based factors into the RHNA methodology. He suggested that factors such as access to education, health outcomes, and climate resilience could help promote equitable housing opportunities and improve access to resources throughout the region. Mr. Pierce acknowledged the benefits of simplifying the methodology but recommended doing so without reducing consideration of key equity factors. He also expressed concerns regarding approaches that would focus primarily on anti-displacement measures or require a complete redesign of the methodology, stating that such options could either fall outside the RHNA framework or unnecessarily complicate the process.

Regional Council Member Doby thanked staff for the presentations and encouraged consideration of additional demographic and socioeconomic factors in future RHNA methodology discussions. She highlighted the growing senior population in many communities and noted that increasing home values might not accurately reflect the financial circumstances of older residents who chose to age in place. Member Doby expressed concern that existing indicators, such as median home value and poverty measures, might not fully capture local conditions and urged further evaluation of factors affecting senior residents, housing affordability, and community-level economic realities to ensure the methodology reflected current housing challenges.

Regional Council Member Manos questioned whether the social equity adjustments used in the prior RHNA methodology effectively addressed the housing needs of disadvantaged communities. While acknowledging the goal of avoiding concentrations of affordable housing, he expressed concern that redistributing housing need away from disadvantaged areas could limit affordable housing opportunities for residents who needed them most. Member Manos emphasized the importance of providing affordable housing near employment centers, transit, and accessible community amenities, and noted the practical challenges of developing affordable housing in high-cost coastal communities. He also encouraged consideration of housing affordability and rental
