housing units that are for seasonal, recreational, and occasional use per ACS data. There are two methodologies utilized to calculate this adjustment, depending on changes in the housing stock over the period of analysis. If both the total number of seasonal, recreational, and occasional use housing units and the overall housing stock increased over the relevant 8-year period, HCD calculates the adjustment based on the proportion of newly added housing units used for seasonal, recreational, or occasional purposes during that time frame. This proportion is then applied as a percentage increase to the preliminary housing need assessment. If, however, the overall housing stock decreased, HCD instead compares the change in the share of seasonal, recreational, occasional use housing units to total housing units. For SCAG, the total number of recreational housing decreased and total housing units increased from 2016 to 2024; therefore, HCD used the first option. From 2016 to 2024, seasonal, recreational, occasional use housing units decreased (-11,110) while there was new housing unit growth (+341,030). Since there was a decrease in seasonal, recreational, occasional use housing units, no adjustment was applied. Note: Data is from the 2016 and 2024 ACS 5-year estimates (B25004), as 2024 1-year ACS data was not available for the necessary tables for all the counties in the SCAG region.

20. Feasible Jobs/Housing Balance Adjustment: According to statute, the “region’s existing and projected housing need shall reflect the achievement of a feasible balance between jobs and housing within the region using the regional employment projections in the applicable regional transportation plan” (Gov. Code § 65584.01, subd. (c)(1)). After applying the adjustments noted above, HCD compared the 7th cycle RHNA determination and the region’s total occupied housing units to employment projections in Caltrans’ Long-Term Socio-Economic Forecast to determine whether a feasible balance was achieved. This analysis resulted in a jobs housing balance of 1.11 (0.9 housing units for every projected job). Because this is below the healthy rate of 1.5, no additional adjustment is needed. Data is from Caltrans’ 2026 Long-Term Socio Economic Forecast as prepared by DOF.
